

ABSTRACT

A power control apparatus includes a bearing seat (12) secured in a mainframe (50) of an electronic device, a rotating portion (14) secured in a display (40) of the electronic device, and a loading board (20) attached to the bearing seat. The bearing seat includes a shaft (122). The rotating portion includes a sleeve (142) pivotally receiving the shaft of the bearing seat. The sleeve has an actuator (144) extending from an end thereof. The loading board includes a suspend switch (30) with an elastic button (34) thereon. The rotating portion is rotatable between a first portion in which the button protrudes from the switch, and a second position in which the button is depressed into the switch by the actuator so that the mainframe terminates signals and power delivery to the display.
